# XYLAZINE WOUNDS

Xylazine is being added to opioids like fentanyl and heroin. It can cause wounds on your arms and legs that start off as purple blisters or small burns. The wounds grow quickly.

If the wound gets down to the muscle or bone, you have to go to the hospital. If you don't get it treated, they might have to amputate.

**If the wound has scabbed over, just leave it alone. DON'T pick off the scab**

**If the wound is open and doesn't have a scab, do this:**

- 1 Clean it (but not with alcohol. That dries it out).
- 2 Put a thin layer of vaseline or antibiotic ointment over it and around the edges.
- 3 Cover it with a bandaid, non-stick gauze or feminine pad and keep it covered.
- 4 Repeat the steps above **every other day**
- 5 Once it scabs over, leave it alone

Xylazine has been confirmed in supplies of light brown powder with very fine granules. But it could be in any fentanyl or heroin
